A network database is a type of
database model wherein multiple
member records or files can be
linked to multiple owner files and
vice versa. The model can be
viewed as an upside-down tree

network structure to create a relationship between entities. Network databases are mainly used on large digital computers. Network databases are hierarchical databases, but unlike hierarchical databases where one node can have a single parent only, a network node can have a relationship with multiple entities.

Information Systems
network database (1) A database
that runs in a server in the
network and is available to
authorized users. (2) A database
of network user addresses. (3) A
database organization method that
allows for data relationships in a
net-like form. A single data
element can point to multiple data
elements and can itself be pointed
to by other data elements.
