Percutaneous

Percutaneous leads positioning in the epidural space. The posterior epidural space, dorsal to the dura, is the target of lead placement for spinal cord stimulation. This space is primarily occupied by fat tissue and small blood vessels, lymphatics and nerve roots laterally.

Spinal Cord

Stimulation:

Implantation

Techniques ...

Spinal cord stimulators (SCS) are implantable medical devices used to treat chronic pain of neurologic origin, such as sciatica, intractable back pain, and diabetic. The device generates an electric pulse near the

Get Free Spinal Cord

spinal cord's dorsal surface, providing a parasthesia sensation that alters the perception of pain by the patient, and is typically used in conjunction with conventional medical management.

Abstract Objectives:

Spinal cord stimulation (SCS) is a well-established modality for the treatment of chronic pain, and can utilize percutaneous or paddle leads. While percutaneous leads are less invasive, they have been shown to have higher lead migration rates.

percutaneous and paddle lead implantation for ...

A person considered a good candidate for spinal cord stimulation therapy is usually scheduled for a trial run, which involves insertion of thin wires with electrodes attached. The trial period is similar to long-term therapy, except that the device

Get Free Spinal Cord

transmitting current is not implanted in the body. Instead, just the wires are inserted and an external transmitter sends electrical pulses to the electrical contacts near the spinal cord.

Spinal Cord Stimulation: The Trial Period

The implantation of spinal cord stimulators

Get Free Spinal Cord

(SCS) may be covered as therapies for the relief of chronic intractable pain.

Therapy consists of a short trial with a percutaneous implantation of neurostimulator electrode(s) in the epidural space for assessing a patient's suitability for ongoing treatment with a
